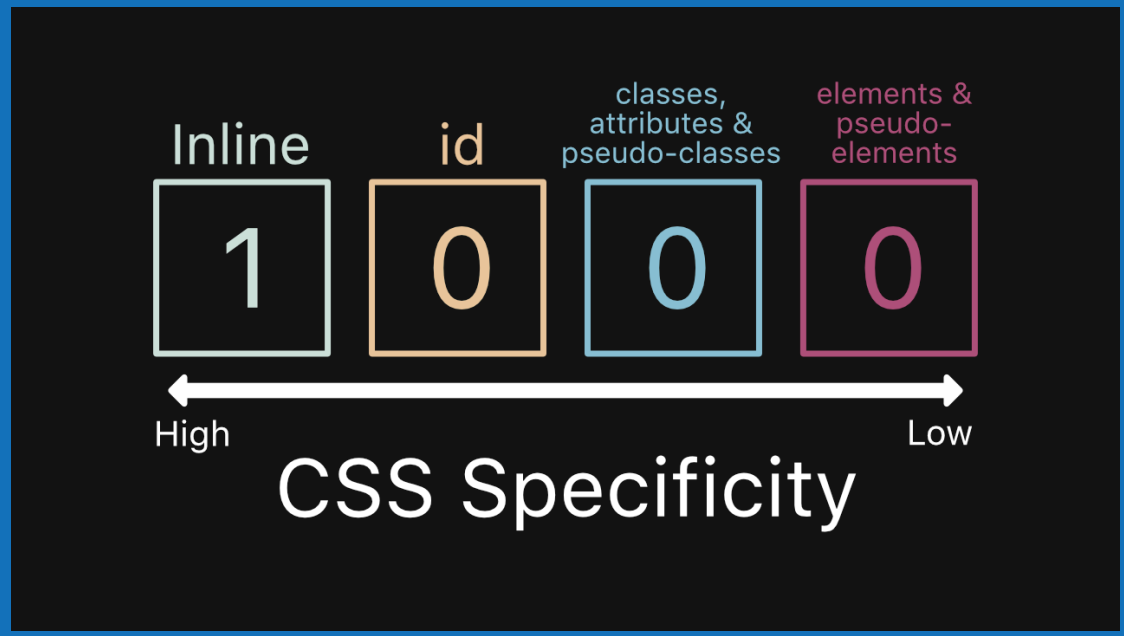
Specificity



www.netlink.com

Specificity

When more than one set of CSS rules apply to the same element, the browser will have to decide which specific set will be applied to the element. The rules the browser follows are collectively called **Specificity**

Specificity means by which browsers decide which CSS property values are the most relevant to an element and therefore, applied.

CSS Specificity

Specificity

Additional Rules

- Although !important gives you a way to say "Forget all those other styles, I want this one to be applied!!!"
- Equal specificity: the latest rule counts
- The universal selector and inherited values have a specificity of 0.
- A class selector beats any number of element selectors.
