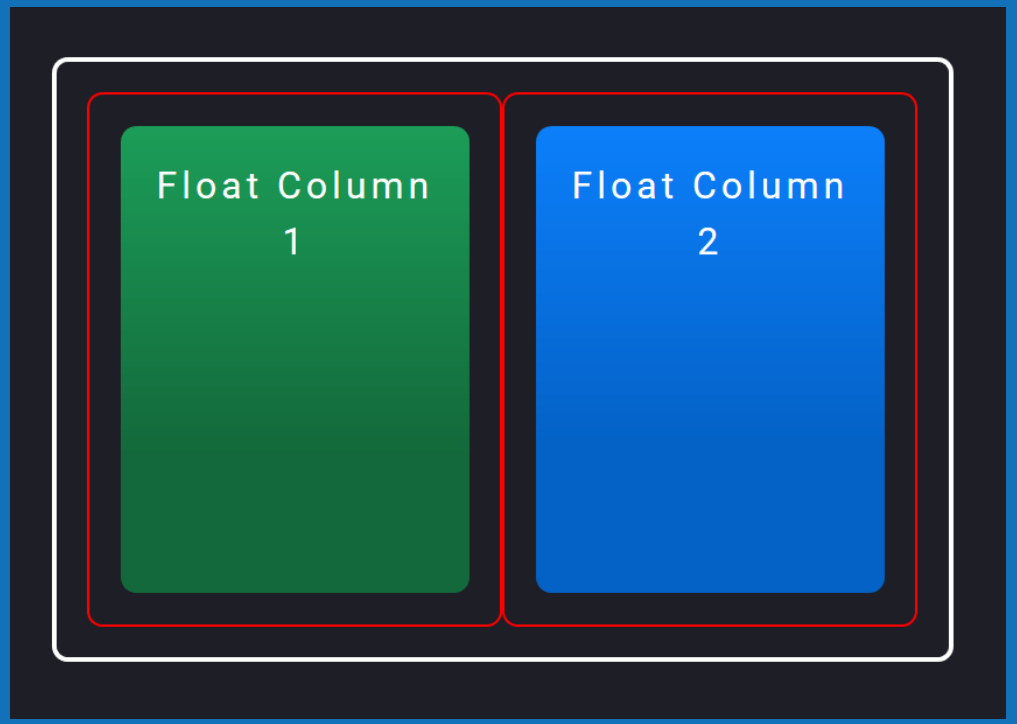
FLOAT



HTML Float

- CSS float is a property that forces any element to float **(right, left, none, inherit)** inside its parent body with the rest of the element to wrap around it.

- This property can be used to place an image or an element inside its container and other inline elements will wrap around it.

For eg. : Images in newspaper and articles are placed in certain position with rest of the content wrapped around it.

- One should keep in mind that this can only be applied to float the element horizontally (i.e. right or left) not vertically.

HTML Float

We can float HTML elements by giving them the following values;

- none – The element does not float. It is default value for any element.
- left – The element floats to the left.
- right – The element floats to the right.
- inherit – The element inherits the value of float from its parent element
