# JavaScript : Variable Mutation

**Mutation**, in general, means a change from an original form. If something is mutable, it can be changed. The same principle applies to JavaScript when you change or add a property to an existing object.

We use **variable mutation** to mutate the value of a variable. In other words, we can change the value of a variable at any time.

```
1  const Person = { name: "John", age: 32 };  
2  
3  console.log("Before mutation - ", Person);  
4  
5  Person.age = 35;  
6  
7  console.log("After mutation - ", Person);
```

**Thank you**
