

Web Designing

Content to be covered :-

- Basics of Internet
- Basics of HTML
- Elements & Attributes
- Basics of CSS
- Link CSS file

What is a Web Application?

A website application, which is also popularly known as a web app, is a program that is usually stored on a remote server, and users can access it using Software known as web-browser.

It is a software application program that uses web-based technology to perform specific tasks.

Its frontend is usually created using languages like HTML, CSS, JavaScript, which are supported by major browsers.

Website Vs Web Application

Website

Static pages:

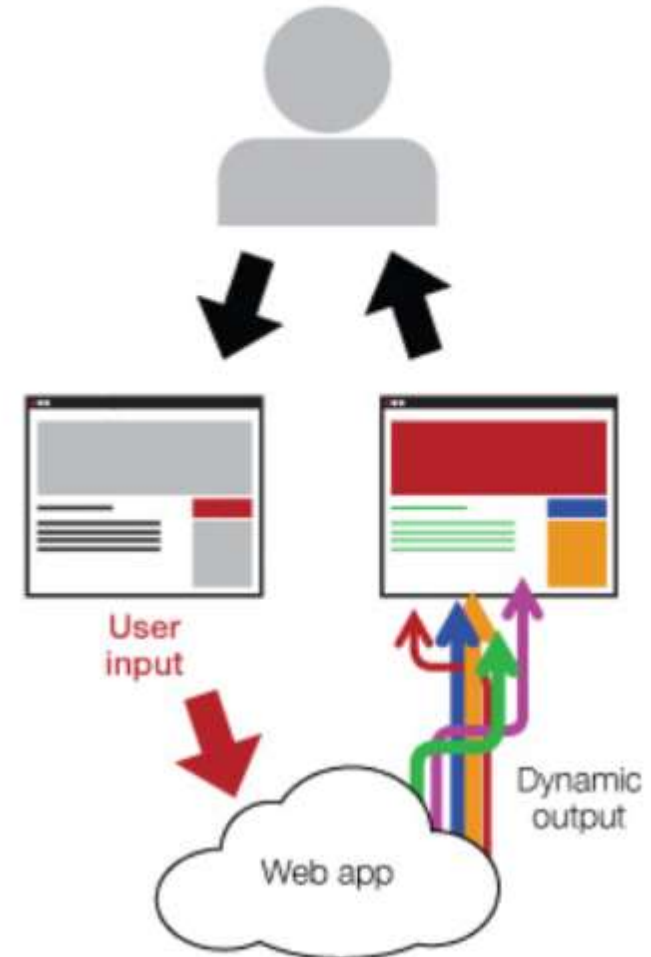

Every user sees the same information each time

Web App

Dynamic pages:

Every user sees the different information depending on their input

Web Application Architecture

The web application architecture describes the interactions between applications, databases, and middleware systems on the web. It ensures that multiple applications work simultaneously.

- In essence, Web Application Architectures can be defined with the depiction of this process:
- A user browses for a specific URL, which the browser locates and requests.
- Over the network, data is sent from the server to the browser, then executed by the browser so that it can display the requested page.
- The user views and interacts with the page.

Components of web application architecture

All applications are made up of two primary components:

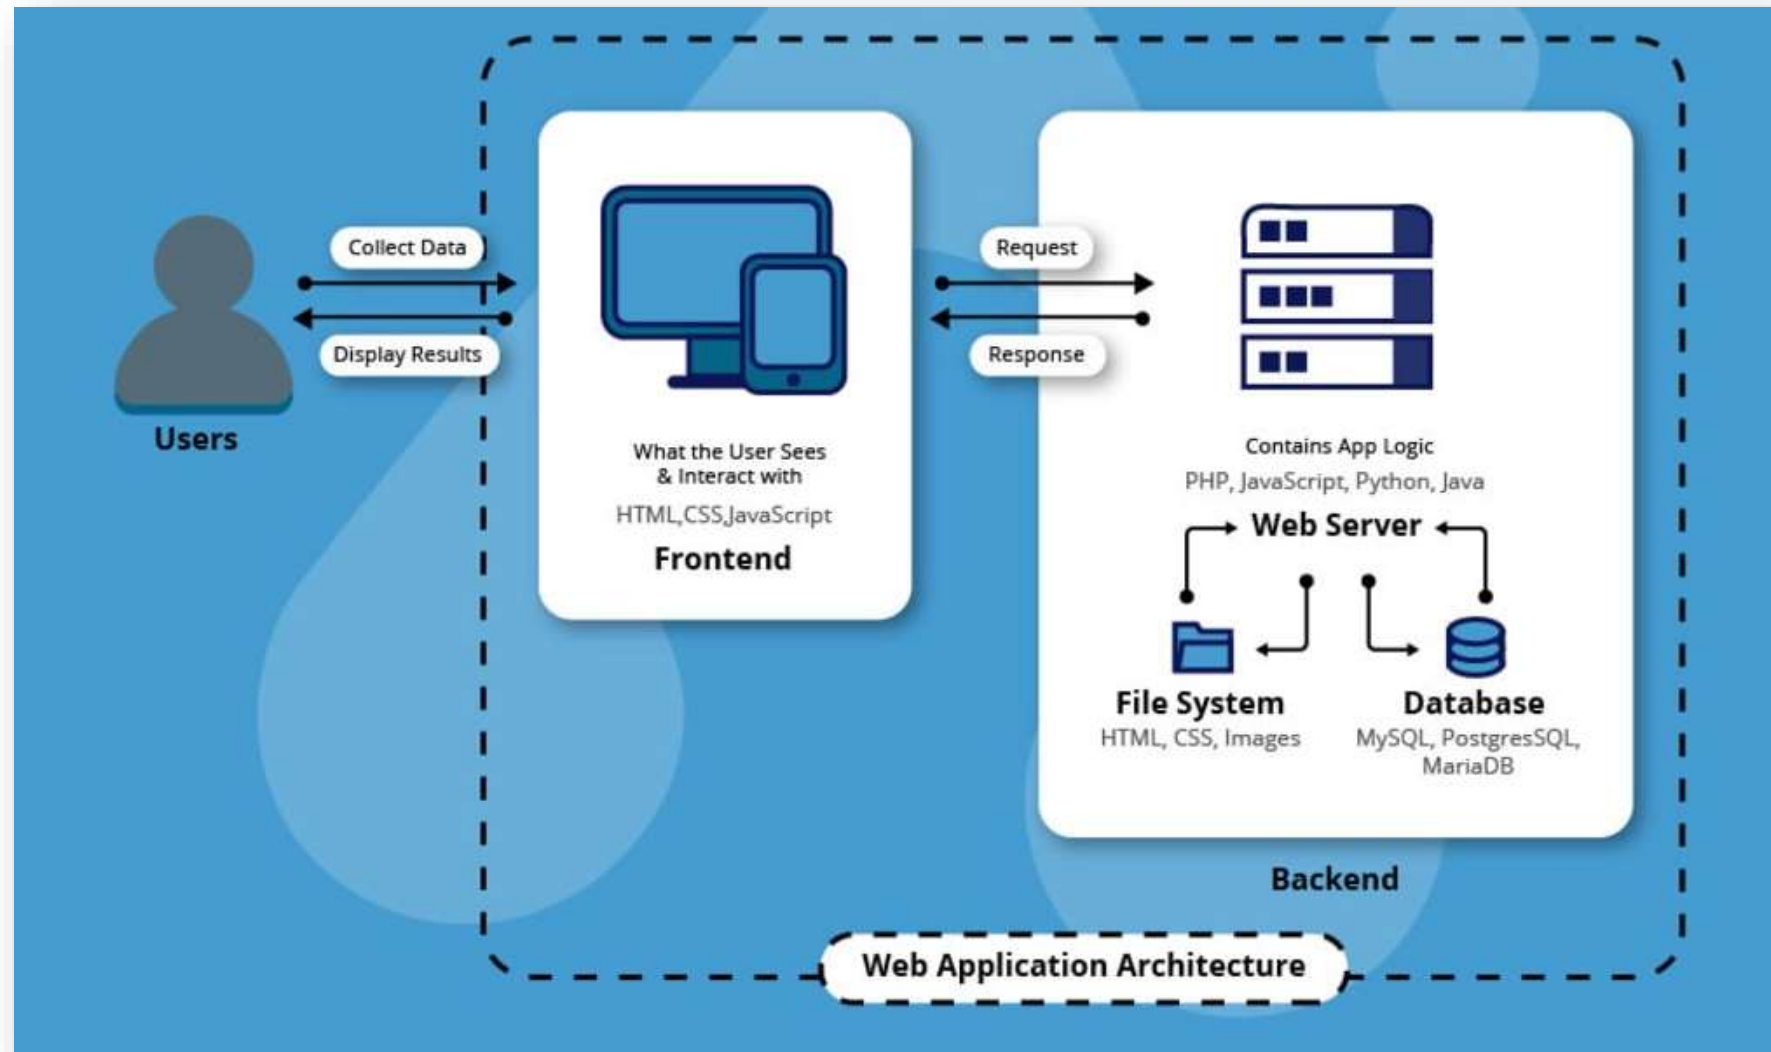

Client-side, popularly called: the frontend, where the code is written in HTML, CSS, JavaScript and stored within the browser. It's where user interaction takes place.

Server-side, also known as the backend, controls the business logic and responds to HTTP requests. The server-side code is written in Java, PHP, Ruby, Python, etc.

Web Application Architecture

APP. (SPA)

MICRO
SERVICES

Types of Web Application Architecture

SERVERLESS
ARCHITECTURES

Types of Web Application Architecture

Three primary types of website application architecture are:

SERVERLESS ARCHITECTURE

It approach to software design that **allows developers to build and run services without having to manage the underlying infrastructure**. Developers can write and deploy code, while a cloud provider provisions servers to run their applications, databases, and storage systems at any scale.

SINGLE PAGE APPLICATION

A single-page application or SPA is a type of web application architecture that interacts with the user by **dynamically** rewriting the current page rather than loading entire new pages from a server.

MICROSERVICES

They can be called small and lightweight services which are responsible for executing a single functionality. The Microservices Architecture framework allows the developers working with it to not only enhance productivity but also speed up the entire deployment process.

Thank you
