

DOM Manipulation

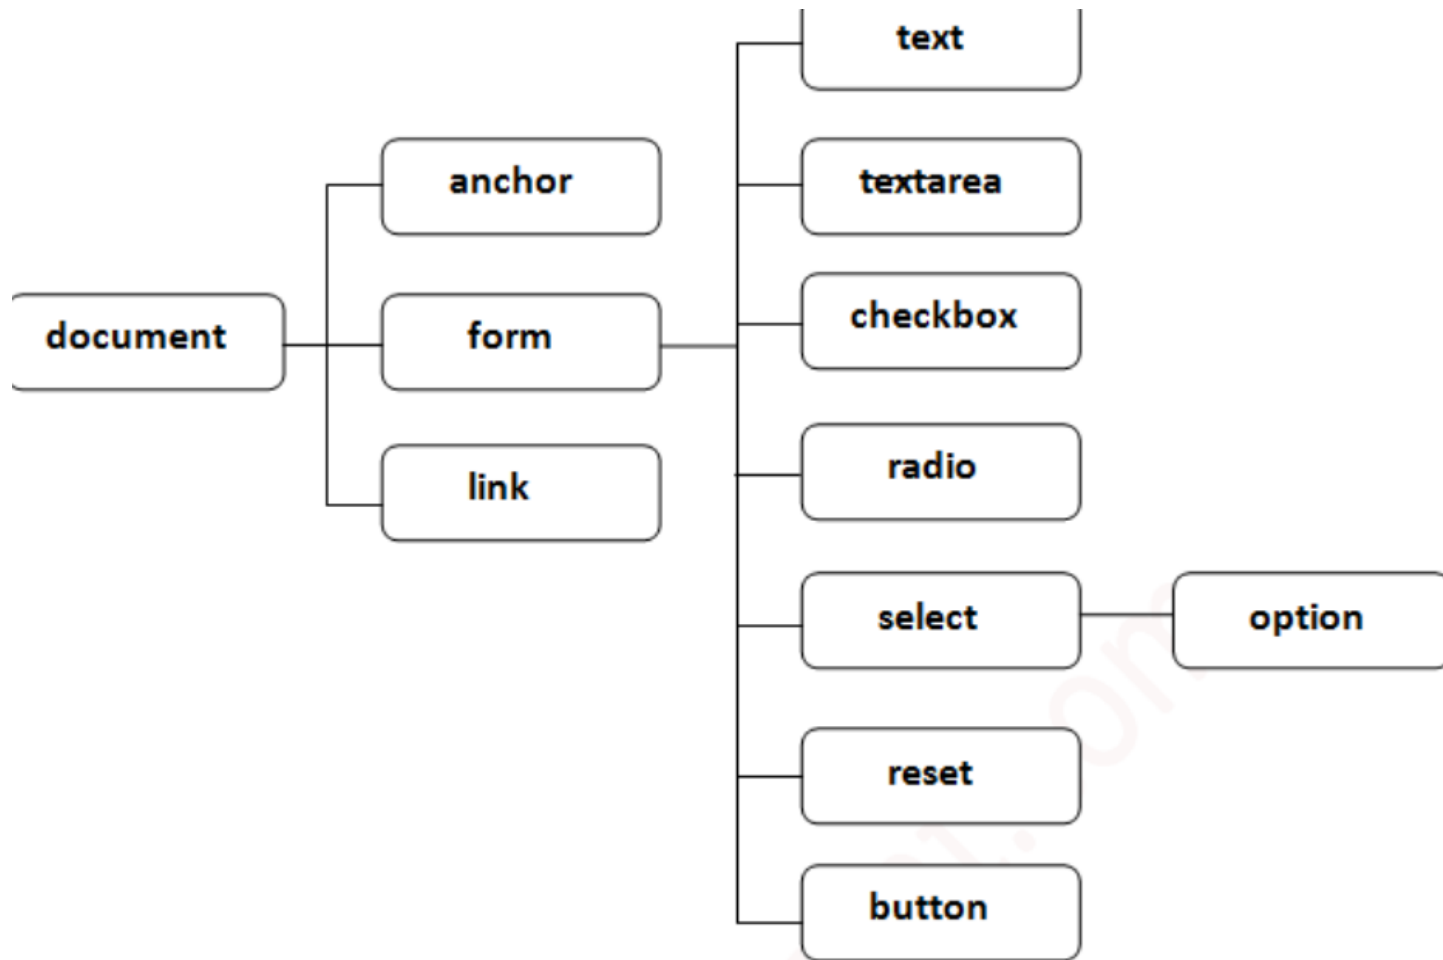

Document Object Model

- The document object represents the whole html document.
- When html document is loaded in the browser, it becomes a document object.
- It is the root element that represents the html document. It has properties and methods.
- By the help of document object, we can add dynamic content to our web page.

JavaScript :DOM

JavaScript interacts with HTML document indirectly by interacting with the **DOM**. With the document object model, JavaScript gets all the power it needs to create dynamic HTML:-

- **JavaScript can change all the HTML elements in the page**
- **JavaScript can change all the HTML attributes in the page**
- **JavaScript can change all the CSS styles in the page**
- **JavaScript can remove existing HTML elements and attributes**
- **JavaScript can add new HTML elements and attributes**
- **JavaScript can react to all existing HTML events in the page**
- **JavaScript can create new HTML events in the page**

Properties of document object

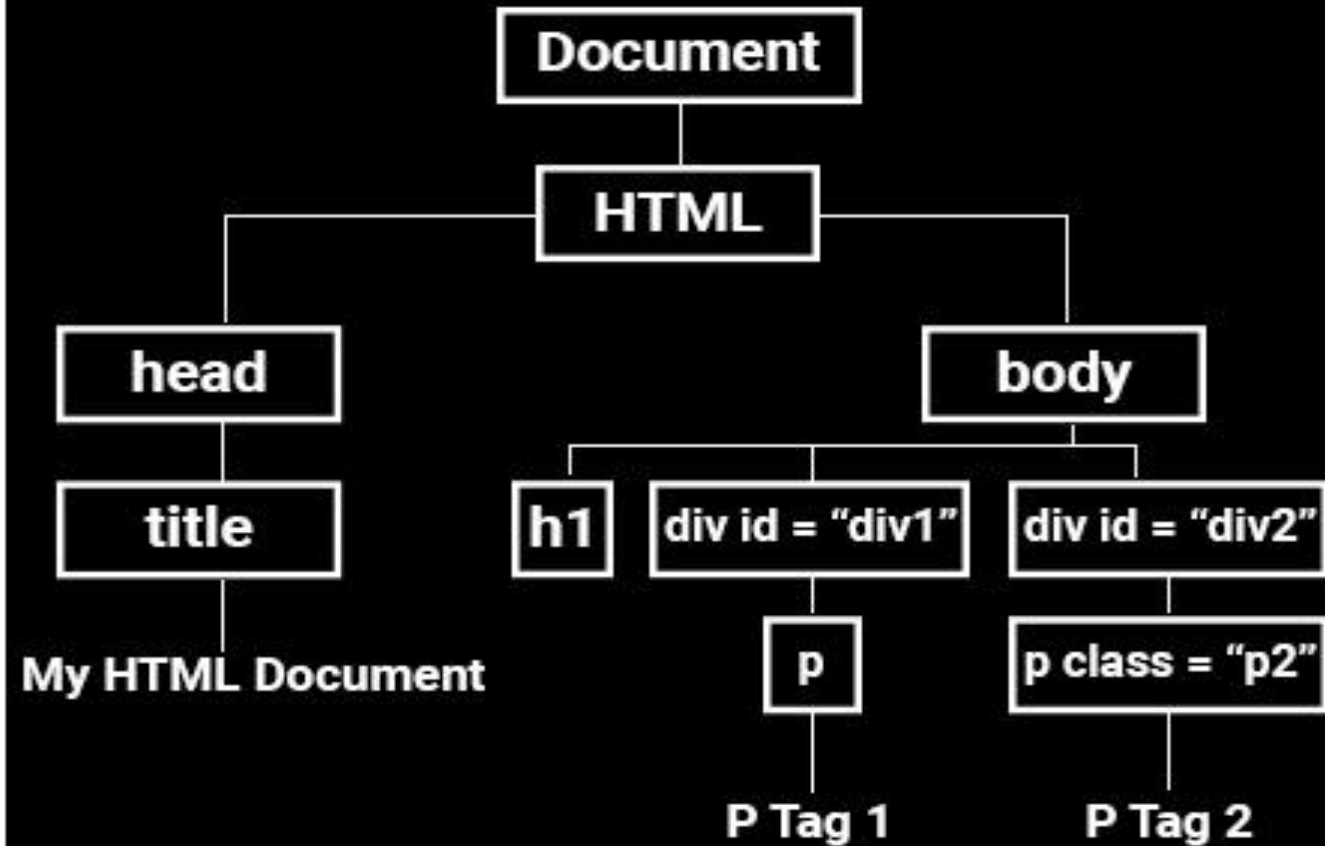

(These are properties of document object that can be accessed and modified by the document object.)

JavaScript :DOM

HTML Document

```
index.html x
1 <html>
2   <head>
3     <title>My HTML Document</title>
4   </head>
5
6   <body>
7     <h1>Heading</h1>
8     <div id="div1">
9       <p>P Tag 1</p>
10    </div>
11    <div id="div2">
12      <p class="p2">P Tag 2</p>
13    </div>
14  </body>
15 </html>
```

Document Object Model (DOM)

JavaScript :DOM

We can access and change the contents of document by its methods.

Methods of Document Object:

- [write\("string"\)](#): Writes the given string on the document.
- [writeln\("string"\)](#) writes the given string on the document with newline character at the end.
- [getElementById\(\)](#): returns the element having the given id value.
- [getElementsByName\(\)](#): returns all the elements having the given name value.
- [getElementsByTagName\(\)](#): returns all the elements having the given tag name.
- [getElementsByClassName\(\)](#): returns all the elements having the given class name.

- Accessing field value by document object
- document.getElementById() method
- document.getElementsByName() method
- document.getElementsByTagName("name") (Here, name is required.)
- innerHTML

innerHTML

- The innerHTML property can be used to write the dynamic html on the html document.
- It is used mostly in the web pages to generate the dynamic html such as registration form, comment form, links etc.

innerText

- The innerText property can be used to write the dynamic text on the html document.
- Here, text will not be interpreted as html text but a normal text.
- It is used mostly in the web pages to generate the dynamic content such as writing the **validation message, password strength** etc.

Thank you
