Media Query

Media Query

- The **Media query** in CSS is used to create a responsive web design. It means that the view of a web page differs from system to system based on screen or media types.
- The **@media** rule, introduced in CSS2, made it possible to define different style rules for different media types.
- Media queries can be used to check many things, such as:
 1. width and height of the viewport
 2. width and height of the device
 3. orientation (is the tablet/phone in landscape or portrait mode?)
 4. resolution

Media Query

- ❖ A media query consist of a media type that can contain one or more expression which can be either true or false. The result of the query is true if the specified media matches the type of device the document is displayed on. If the media query is true then a style sheet is applied.

Thank you
